

aphasol

Nutrient science by Damaco Group

Maximise your crop potential with Aphasol™ biostimulant

Onions | shallots | garlic

-  Improved stress tolerance
-  Optimisation of nutrient use
-  Larger calibres
-  Higher yields

Aphasol is a highly effective liquid biostimulant for foliar application. It increases **abiotic stress tolerance** and improves **uptake and efficient use of nutrients** by the plant. Indeed, Aphasol provides the necessary **amino acids**, allowing plants to save time and energy, resulting in higher yields and better quality onions, shallots and garlic.

Aphasol is developed and produced in Belgium,
using pure, unprocessed by-products from local poultry processing plants.

MADE IN BELGIUM

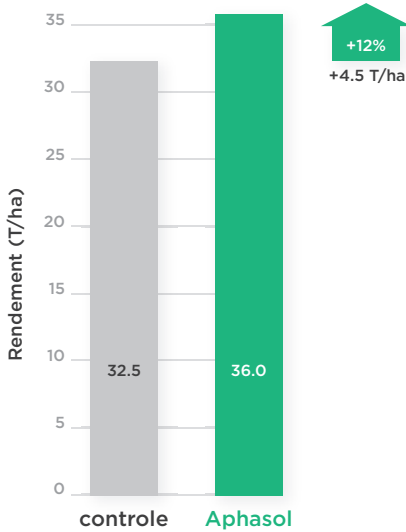

Test results

Produce 6 trials

in 2022-2023 in Belgium and the Netherlands with yields < 50 T/ha, due to abiotic stress conditions

controle

Aphasol

- Visible improvement in **phytotoxic resistance** after early herbicide treatments, resulting in faster vegetative recovery.
- More and longer **roots**.
- Better **vegetative growth**.
- Later onset of bolting (BBCH49), the foliage of the onions stay **green longer**.

“ At harvest, the yield difference could be seen with the naked eye. There were also more onions of larger calibre, which is positive to cost for further processing.

FREDERIK GOEDHUYTS | Linter

Application advice

- Aphasol is a **foliar application**. The product is soluble in water and can be used in combination with most common fertilisers and crop protection products, in a tank mix of 2-5%.
- Dosage: **1.5-2 L/ha** from second leaf stage (BBCH12), with any crop protection product treatment.
- An adjuvant is recommended if not already present in the mixture of crop protection products.
- Also available for **organic farming**.
